1. To check the transformers have been correctly wired, put your meter on dc resistance, the lowest setting, place the black probe into input 1, left channel, and the red probe into the left channel output either 1 or 2. Have the selector in position 1 and the volume in position 23. The meter should read 0 ohms, by gradually turning round to position 1, the resistance will rise to 63 ohms.
2. Do the same to the right channel.
3. If all is good, you have built yourself a very fine pre-amplifier indeed. Enjoy.
